Abstract of the Disclosure

5 A generally horizontally sliding door includes a sliding or otherwise
translating door panel with a full-perimeter seal that engages sealing surfaces upon
closing and at least partially disengages the surfaces upon opening. The door panel
~ travels along an overhead track that is slightly inclined to lower the panel's upper and
lower edge seals into engagement with sealing surfaces as the door closes. To provide
10 a substantially full-perimeter seal, a leading edge seal and a trailing edge seal engage
sealing surfaces as well. Some of the edge seals are joined to create corner seals. The
seals are adapted for single panel sliding doors, bi-parting doors, multi-panel doors,
and various combinations thereof.
